PROFESSIONAL SUMMARY

Full Stack Software Engineer with **5+ years** of experience shipping production web applications for a B2B SaaS platform serving **800+ active clients** and **6,000+ users**. Proven track record of owning features end-to-end, from data modeling and UI development to AI service integrations (AWS Textract) and fiscal process automation. Hands-on experience building queue-driven, asynchronous backend systems with **NestJS**, **PostgreSQL** and **RabbitMQ** through personal projects, focused on idempotency, retry strategies and fault tolerance. Strong background in React, TypeScript, GraphQL, Docker, CI/CD and cloud infrastructure. Advanced English (C1).

WORK EXPERIENCE

Software Engineer

Apr. 2021 – Present

Wonder Sistemas | B2B SaaS Platform (800+ clients, 6,000+ users)

Erechim, Brazil

- **Owned the expense-management module end-to-end**, from data modeling and dynamic forms to card-payment/installment business rules and backend integrations, building it from scratch into a production feature used by dozens of enterprise clients.
- Built a **type-safe GraphQL contract** between separate front-end and back-end repositories via **code generation**, turning the CI type-check into a gate that blocks queries referencing non-existent backend fields, catching in seconds a class of bug that previously surfaced only at runtime in production; cut contract debt from **21 to 3 broken queries**.
- Designed a **four-layer automated testing strategy** (unit → integration → GraphQL contract → **Playwright E2E**) with explicit front/back responsibility boundaries, prioritizing long-term maintainability over coverage numbers; reached **100% smoke coverage** across all SPA routes and migrated a fragile snapshot suite from Jest snapshots to behavioral tests using **Vitest** and React Testing Library.
- Led the incremental **JavaScript → TypeScript migration** of legacy production modules, converting Apollo class-component HOCs into **typed functional components with hooks** and removing Redux from business state (kept only for auth/session).
- Diagnosed a months-long **intermittent production bug** in a specific mutation that failed **roughly half the time** (yet passed in isolation), tracing the root cause to **Oracle session-pool state** (NLS/PL-SQL) rather than the request payload; collaborated with backend engineers on the database-layer fix and validated the resolution through real concurrent load (**0% → 100% success over 10 runs**).
- Delivered an automated invoice-reading flow **powered by AWS Textract** OCR (NFC-e) with expense-form auto-fill, plus **QR-code scanners** pulling invoice keys from the Brazilian tax-authority (SEFAZ) portal, eliminating manual data entry.
- Engineered **CI/CD pipelines (GitHub Actions)** with event-differentiated gates, only diff-affected tests on pull requests, the full sharded suite on merge, containing CI cost without weakening deploy protection; **Docker**-based builds and deployments.

Chatbot Development Intern

Feb. 2021 – Apr. 2021

Compass UOL (Software House)

Erechim, Brazil (Remote)

- Developed chatbots in **Node.js** integrating **IBM Watson Assistant** and the Blip platform, focused on conversational flow automation, external API integration and backend development.

HIGHLIGHTED PROJECT

Async Webhook Ingestion Platform | *NestJS, PostgreSQL, RabbitMQ*

2026

- Built a B2B webhook ingestion platform that receives marketplace events and processes them asynchronously through a **RabbitMQ-based architecture**, decoupling request intake from background processing.
- Implemented reliability guarantees for event ingestion, including **HMAC-SHA256 signature validation**, replay protection, **event-level idempotency**, and transactional persistence to prevent duplicate side effects under redelivery.
- Designed a fault-tolerant message pipeline with **publish-confirm**, exponential backoff retries, TTL retry queues, and **dead-letter queues**, preserving processing reliability across transient and permanent failures.
- Instrumented the system end-to-end with **Prometheus metrics**, Grafana dashboards, structured logs, and correlation ID propagation across the API, RabbitMQ, workers, and database, making every event traceable through the full processing lifecycle.
- Validated the architecture's performance through reproducible benchmarks (**p99 $\approx$ 65 ms**) over the containerized environment (**Docker Compose**), automated validation in CI, and documented key architectural decisions through ADRs in the public GitHub repository.

EDUCATION

Regional Integrated University of Upper Uruguay and the Missions (URI)

B.Sc. in Computer Science

Erechim, Brazil

2021 – 2024

HarvardX | edX

CS50x: Introduction to Computer Science

Online

2021

Federal University of Santa Maria (UFSM)

B.Sc. in Business Administration

Santa Maria, Brazil

2016 – 2019

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL

Front-End: React, Next.js, Redux, Context API, Tailwind CSS, SCSS, Styled Components, CSS Modules

Back-End: NestJS, Node.js, Express, REST, GraphQL, RabbitMQ

Databases: PostgreSQL, MongoDB (Mongoose), MySQL

Infra & DevOps: Docker, AWS (Textract, S3), GCP, Git, CI/CD (GitHub Actions, Vercel)

Testing: Vitest, Jest, React Testing Library, Playwright
